high speed fold-up doors

The high speed fold-up doors are mainly suitable to close medium and big areas, they can be installed both inside or outside of every kind of industrial building

doors for big rooms

The high speed fold-up doors for big rooms are suitable where you need to improve the internal logistics of big-dimensions industrial areas.

high speed doors for car wash

The high-speed fold-up doors for car wash are supplied with a traffic-light that indicates the possibility of entering it or not. They make you save a lot of energy, thanks to the reduced heat wasting.

high speed roll-up doors

The high speed roll-up doors are suitable where you need to improve the internal logistics in small and medium industrial areas, also in food and chemical-pharmaceutical areas.

high speed roll-up doors

The high speed roll-up doors with counterweighted panel for intensive use have a minimum encumbrance, so they can be installed in small spaces. A transparent part guarantees traffic visibility and brightness. It is possible to use it as an emergency exit.

flexible doors with leaves

The flexible doors with one or two leaves are suitable to divide industrial buildings where it is necessary to close a room without limiting the pedestrian crossing.

polyethylene doors

The polyethylene doors are suitable to divide rooms where it is important to keep optimal sanitary conditions; for this reason they are usually used in hospitals, food areas in supermarkets, food industries and pharmaceutical industries.

strip curtains

The strip curtains are a cheap and practical solution for closing rooms in high-traffic areas. They can be used inside or outside the buildings. A version for low temperatures, that can be used in cold rooms, is also available.

overheads

The overheads are vertical-movement automatic closures. The stiff panel, that makes the closure, guarantees a thermic and acoustic insulation.

tunnels

The tunnels are frameworks conceived to protect external working areas from weather factors. The internal framework is made of zinc-plated tubes; on them the covering Trevitex panel is installed.

dock-shelters

The isothermic dock-shelters are used to make easier the loading / unloading operations between lorries and industrial buildings. The frontal part of the dock-shelter fits to the shape of the lorry, so it reduces the heat losses between the building and the external area.

partition walls

The partition walls Trevitex are suitable to separate industrial buildings in different units, to insulate some working areas from dust and noise, in order to create protected working areas and to reduce energy wasting.
